ARTICLE

The Winter Fuel Crisis Is Building - And America Won't Be Immune

BY PNW STAFF SEPTEMBER 18, 2026

Winter hasn't arrived yet, but the warning signs are already flashing.

Diesel has climbed above \$6 a gallon in the United States. Heating-oil customers are being warned to prepare for dramatically higher bills. Fuel shortages and rationing are appearing overseas. Factories are being disrupted. Transportation workers are protesting. Governments are scrambling to subsidize fuel, calm angry populations and keep energy moving.

And all of this is happening before the Northern Hemisphere enters the coldest months of the year.

Americans may look at fuel protests in Syria, shortages in Indonesia or blackouts in Bangladesh and assume this is someone else's crisis. But energy markets don't respect national borders. The same global system that is producing shortages and unrest overseas is already pushing American fuel prices into territory that would have seemed

extraordinary just months ago.

The question is no longer whether America will feel the global fuel crisis.

It already is.

\$6 Diesel Changes More Than The Price At The Pump

The national average price of diesel reached \$6.285 a gallon for the week ending September 14, according to the U.S. Energy Information Administration. Just five weeks earlier, it was \$5.257.

That's especially significant because diesel isn't simply another fuel Americans purchase.

It is one of the fuels that makes the American economy move.

Diesel powers the trucks hauling groceries to supermarkets, tractors harvesting crops, construction equipment building homes and infrastructure, and countless commercial vehicles moving goods across the country.

CNN recently highlighted the pressure farmers are experiencing during harvest, including one farmer who said filling his combine was approaching \$1,000. Higher harvesting and transportation expenses don't simply disappear. Eventually, businesses have to absorb them, cut expenses elsewhere or pass some portion of them along.

That is how an energy crisis becomes a food-price problem.

A farmer pays more to harvest the corn. The trucker pays more to transport it. The processor pays more to manufacture and package the finished product. Another truck carries it to a distribution center. Another carries it to the supermarket.

Fuel is embedded at virtually every stage.

And Then Comes Winter

The timing couldn't be much worse.

CNN reports that Americans who heat their homes with heating oil are projected to spend approximately 31 percent more this winter, with the estimated seasonal cost reaching roughly \$2,300. Natural-gas heating costs are projected to increase about 6 percent and electricity around 9 percent.

Heating oil is particularly vulnerable because it comes from the same distillate portion of the petroleum market as diesel. When diesel supplies tighten, the pressure can spill directly into home heating.

Only about 4 percent of American households primarily use heating oil, but those homes are heavily concentrated in New England and the Mid-Atlantic.

For millions of families, therefore, \$6 diesel isn't an abstract trucking statistic.

It could become a winter household-budget crisis.

And we're still in September.

Overseas, We Can Already See What Happens Next

Around the world, much more severe versions of the same pressures are producing extraordinary scenes.

Syria raised standard diesel prices by approximately 40 percent, helping trigger widespread demonstrations in which protesters blocked roads and burned tires. The backlash became strong enough that the government announced discounted diesel for heating, agriculture and industry.

In Indonesia, motorists in Makassar have encountered enormous lines for subsidized fuel, some stretching more than a kilometer. Authorities have increased supplies and even introduced remote work for some government employees in an effort to ease pressure. Protests have followed.

Bangladesh is facing an even more sobering consequence. Energy shortages have contributed to blackouts and disruptions at garment factories as the country struggles with expensive imported energy.

And Europe is entering winter with another problem: natural-gas storage levels are considerably below their normal seasonal level. Reuters reports European storage at approximately 69 percent full compared with a five-year seasonal average of 85 percent.

Different countries. Different economies. Different circumstances.

But the pressure point is remarkably similar: energy becomes expensive or scarce, transportation and industry suffer, household budgets get squeezed, and eventually public anger begins spilling into the streets.

Could Shortages And Rationing Come Here?

There is no widespread fuel rationing in the United States today, and predictions that nationwide rationing is inevitable would go far beyond the evidence.

But Washington is already taking unusual steps to keep fuel moving.

The Transportation Department has temporarily relaxed hours-of-service restrictions for drivers transporting gasoline and diesel. The 90-day measure allows qualifying drivers to work longer daily windows as the government attempts to reduce fuel-delivery delays amid supply and price pressures.

Meanwhile, another vulnerability emerged this week when Exxon Mobil's 275,000-barrel-per-day Joliet refinery in Illinois went offline following a power outage and flooding problems. The refinery normally supplies roughly 11 million gallons of gasoline and diesel per day to the Midwest.

That doesn't mean America's pumps are about to run dry.

It does demonstrate how quickly an already tight market can encounter another problem.

A refinery outage here. A pipeline disruption there. Another geopolitical shock. Severe winter weather. A transportation bottleneck.

Individually, the system can usually absorb such events. The danger comes when several

occur simultaneously.

The Domino Effect

This is why Americans should be watching more than the numbers displayed outside the neighborhood gas station.

The first domino is fuel.

Behind it are trucking, agriculture, shipping, manufacturing and home heating. Behind those come grocery prices, retail prices, factory costs and household budgets.

And then there is another possibility already visible overseas: labor unrest.

When truckers, fishermen or transportation workers conclude that fuel prices make operating economically impossible, the consequences can extend far beyond those industries. France has already seen fishermen blockade a fuel depot amid broader labor unrest, while strikes have affected operations at the country's largest LNG terminal and parts of its energy sector.

Imagine even a relatively short disruption in American trucking combined with already elevated diesel prices. Grocery deliveries don't wait indefinitely. Neither do fuel deliveries, manufacturing inputs or agricultural shipments.

Modern economies are extraordinarily efficient because everything moves quickly.

That efficiency can also make them extraordinarily dependent upon uninterrupted energy.

Winter Will Be The Real Test

America remains in a far stronger energy position than many countries now experiencing shortages. U.S. crude production is actually on track for another record in 2026, averaging 13.7 million barrels per day during the first half of the year.

That is important context. America is not Bangladesh or Syria.

But record crude production doesn't automatically produce unlimited diesel, gasoline or heating oil. Refining capacity, inventories, transportation infrastructure and international

demand all determine whether crude oil ultimately becomes the fuel consumers need where they need it.

That is why the coming months deserve attention.

The global fuel crisis is no longer something Americans can watch safely from across an ocean. Its effects are already appearing in trucking costs, farming expenses, gasoline prices and winter heating projections.

Overseas, we are getting a glimpse of what happens when those pressures become severe enough: rationing, shortages, factory disruptions, protests and government intervention.

America isn't there.

But winter hasn't arrived either.

And if \$6 diesel is what September looks like, Americans have every reason to pay attention to what December, January and February could bring.
