ARTICLE

Your Money Is Going Digital - And Soon It May Come With Conditions

BY PNW STAFF OCTOBER 08, 2026

Share this article:

Share Post Email Share Print

Something significant is happening to money in Canada, but Americans shouldn't make the mistake of thinking this is merely a Canadian experiment.

Six of Canada's largest banks — BMO, CIBC, National Bank, RBC, Scotiabank and TD — have announced that they are jointly exploring a Canadian-dollar tokenized deposit system. The banks say the project is intended to provide customers with faster and more efficient payments.

But there is another word in the announcement that deserves attention.

"Programmable."

The banks specifically say their project seeks to deliver "faster, more efficient and programmable payments" to Canadian customers. The first phase would allow tokenized deposits to move efficiently between Canadian financial institutions, while the longer-term goal includes connecting the system with other emerging digital-asset initiatives.

For most consumers, this will probably sound like another technological upgrade. Faster transfers. Instant settlement. Fewer delays. Payments operating around the clock.

And there are legitimate advantages to all of those things.

But programmable money introduces a capability that traditional money has never possessed on this scale: money can potentially interact with rules governing how and when a transaction takes place.

That changes the conversation.

A Dollar That Can Follow Instructions

Cash is remarkably simple.

A twenty-dollar bill does not know who owns it. It doesn't know your political opinions, your location or what you intend to purchase.

It simply represents value.

Programmable digital money is different.

Conditions can potentially be incorporated into transactions through software. A payment could be released when a contractual requirement is satisfied. Funds could automatically move when goods arrive. A financial transaction could execute only after predetermined conditions have been met.

Many applications would be enormously useful.

But the same capability raises an unavoidable question:

If money can obey rules, who ultimately gets to write the rules?

Canada's banks have not announced a system allowing the government to dictate what groceries Canadians may purchase or where individuals may spend their money. Claims that this has already happened go beyond the evidence.

But that isn't really the point.

The significance is that financial infrastructure is being developed in which programmability becomes a normal feature rather than a theoretical possibility.

And Canada isn't doing this in isolation.

This Is Becoming A Global Financial Project

Canada has joined Project Agorá, an international initiative organized by the Bank for International Settlements.

The project is experimenting with a multi-currency system combining tokenized commercial-bank deposits with wholesale central-bank money on a shared programmable platform.

And it is no longer merely theoretical.

In July 2026, 28 financial institutions and central banks across Asia, Europe and North America conducted real-value transactions through Project Agorá. The Bank for International Settlements says the technology can embed "workflow logic, compliance requirements and conditional payment triggers directly into transactions."

The average settlement time during the test was approximately 80 seconds.

The project now involves eight central banks and more than 40 financial institutions. It spans major currencies and financial centers across North America, Europe and Asia.

In other words, the financial world isn't simply digitizing money.

It is experimenting with making digital money interoperable across borders — and programmable.

Europe Adds Digital Identity

Europe is moving aggressively into this new financial environment.

The EU is pursuing the digital euro while simultaneously requiring member states to provide European Digital Identity Wallets by the end of 2026. Those wallets are intended to allow Europeans to prove their identity and store official credentials for interactions with government and private services.

Canada and the European Union also maintain a formal Digital Partnership covering areas including digital identity, data governance and cybersecurity. At their October 1 Digital Dialogue, officials discussed digital credentials and wallets.

Meanwhile, Canadian and European financial officials have discussed the digital euro, Canada's developing stablecoin framework and tokenization in financial markets.

There is no announced agreement to merge Canada's proposed bank tokens with the digital euro.

But the broader direction deserves attention.

Digital identity is expanding.

Digital money is expanding.

Tokenization is expanding.

Cross-border interoperability is expanding.

And programmable transactions are moving from laboratory concepts toward real-world financial infrastructure.

Americans Shouldn't Think This Stops At The Border

It would be easy for American readers to look north at Canada or across the Atlantic at Europe and assume this is something happening somewhere else.

It isn't.

The United States is already deeply involved in the same transformation.

The Federal Reserve Bank of New York participates in Project Agorá alongside central banks from Europe, Britain, Japan, South Korea, Mexico and Switzerland.

Meanwhile, J.P. Morgan has already launched JPM Coin, a U.S.-dollar-denominated deposit token available to institutional clients. The bank says its blockchain infrastructure has processed trillions of dollars in transactions and billions of dollars on an average day.

Washington is also building a regulatory framework for another form of digital money: payment stablecoins.

Under the GENIUS Act, federal banking regulators are developing rules governing permitted stablecoin issuers, reserves, customer identification and other requirements.

This does not mean the United States has adopted a retail central bank digital currency or that Washington can suddenly program how Americans spend every dollar.

It does mean America is traveling down the same broader road toward tokenized, always-on and increasingly interconnected digital finance.

The technology may differ from country to country. One nation may emphasize a central-bank digital currency. Another may rely primarily on regulated stablecoins. Another may use tokenized commercial-bank deposits.

But the destination could still produce something remarkably similar:

Money existing on digital networks capable of communicating with identity systems, compliance systems and financial institutions almost instantly.

The architecture is becoming global.

Canada Has Already Crossed One Important Line

Canadians have another reason to pay attention.

During the 2022 Freedom Convoy protests, the Canadian government invoked the Emergencies Act and gave financial institutions authority to freeze or suspend accounts associated with the blockades without first obtaining a court order.

The lesson goes beyond whether someone supported or opposed the convoy.

Canada demonstrated something important:

Access to the financial system can become an instrument of government policy.

And Canada accomplished that using relatively conventional banking infrastructure.

So what happens when tomorrow's infrastructure becomes instantaneous, interconnected and programmable?

That is a question Americans should be asking too.

Governments do not need programmable money to freeze accounts today. Banks already enforce sanctions, court orders and anti-money-laundering requirements.

But tomorrow's financial infrastructure could make enforcement far faster, more automated and potentially more granular.

The issue isn't simply whether authorities can restrict someone's financial activity.

Increasingly, the question may become how quickly, comprehensively and automatically such restrictions can be implemented.

The Bible Described Conditional Commerce Long Ago

For students of Bible prophecy, the implications are difficult to ignore.

Revelation 13 describes an extraordinary future economic system in which participation in commerce becomes conditional. Those who refuse allegiance to the Beast are unable to "buy or sell."

For generations, Christians could understand the prophecy theologically while struggling to imagine how such comprehensive economic control could actually be enforced.

How could authorities monitor millions — potentially billions — of transactions?

How could someone's identity be connected instantly with permission to participate in commerce?

How could restrictions follow an individual from one financial institution to another — or even across borders?

Those questions aren't nearly as difficult to answer anymore.

We should be careful here.

Canada's tokenized deposits are not the Mark of the Beast.

The digital euro isn't the Mark.

America's stablecoins aren't the Mark.

Digital identity isn't the Mark.

Project Agorá isn't the Mark.

But Bible prophecy does tell us that a time will come when identity, allegiance and economic participation become connected in ways that determine whether a person may buy or sell.

Consider what is now developing simultaneously:

Digital identity establishes who you are.

Digital financial networks establish what money belongs to you.

Programmability allows transactions to interact with predetermined rules.

Compliance technology determines whether transactions satisfy those rules.

Interoperability allows these systems to communicate across financial institutions and national borders.

For the first time in human history, the technological architecture capable of facilitating something resembling that level of economic control is becoming conceivable — and increasingly ordinary.

And perhaps that is the development worth watching most closely.

It Probably Won't Be Sold As Control

No government needs to announce, "We are building an economic control system."

The transformation will be sold on its legitimate benefits.

Faster payments.

Less fraud.

Lower transaction costs.

Instant international transfers.

Protection against money laundering.

Digital identity.

Twenty-four-hour banking.

Programmable payments.

And many of those improvements could genuinely make life easier.

But technology created for convenience can also create capabilities its original users never intended.

Once the infrastructure exists, its ultimate character depends upon who controls it, what rules are attached to it, what safeguards protect individual liberty — and whether citizens retain meaningful alternatives.

That is why Americans should pay attention to what is happening in Canada and Europe.

They are not watching someone else's future.

The United States is already participating in the same global transformation.

Money is becoming digital.

Money is becoming interconnected.

And increasingly, money is becoming capable of following instructions.

The question that may ultimately matter most is not whether programmable money is coming.

It is who will be doing the programming.
